

Description of files in this folder

The files in this folder pertain to the plots and statistical analyses of mouse behavior and core body temperature following administration of GDCA or vehicle by either retro-orbital injection or oral gavage.

As described in the text, there were four relevant cohorts of mice: three male cohorts and one female cohort. In the first male cohort, GDCA was administered by retro-orbital injection at 0.4 mg/kg/day for 3 days, followed by testing on days 4 and 5. In the remaining cohorts, GDCA was administered by oral gavage at either 10 or 50 mg/kg, followed by same-day testing. Each experiment included the appropriate vehicle controls.

For each cohort, this folder contains R Markdown files with the relevant prefix:

- male_cohort_1_RO
- male_cohort_2_PO
- male_cohort_3_PO
- female_cohort_PO

The input data, and output plots, are in the corresponding subfolders:

- Male cohort 1 – RO
- Male cohort 2 – PO
- Male cohort 3 – PO
- Female cohort – PO

Each subfolder also contains an Excel whose name starts with “Stats” that records the results of statistical testing conducted within the Rmd files.
