

Description of files in this folder

1. run_trim_galore.sh
 - a. Command used to run TrimGalore on the samples
 - b. FASTQs are available under NCBI BioProject ID PRJNA1328687
2. star_index_script.sh
 - a. Bash script that was used to create the STAR index for STAR alignment (see below)
3. star_alignment_script.sh
 - a. Command that was used to run STAR alignment on the trimmed fastq files, in order to prepare for differential splicing analysis with rMATS-turbo
4. rmats_turbo_script.sh
 - a. Bash script that was used to run rMATS-turbo after STAR alignment, for both experimental plates
 - i. Plate 1 = TMAO-treated samples and their corresponding vehicle-treated controls
 - ii. Plate 2 = pladienolide B-treated samples and their corresponding vehicle-treated controls
 - b. Relevant rMATS-turbo outputs are located in the rMATS-turbo-outputs subfolder
5. differential_splicing_events.Rmd
 - a. Inputs: the files in the rMATS-turbo-outputs folder
 - b. Outputs: Excel files used for a supplementary table
6. sashimi_code subfolder
 - a. Contains files used to generate supplementary sashimi plots of differential splicing events in neuroblastoma cells treated with pladB vs. vehicle (4h treatment) or TMAO vs. vehicle (3h treatment).
 - b. Specifically contains:
 - i. Files containing the commands used to run ggsashimi.py (which was downloaded from <https://github.com/guigolab/ggsashimi> on June 26, 2025)
 - ii. Input files required for running those commands:
 1. palette_vehicle_grey.txt
 2. bam_list_tmao.txt
 3. bam_list_pladB.txt
 - iii. Raw output PDFs of the ggsashimi commands, which were later edited in Illustrator to reduce visual clutter and emphasize the junctions relevant to each differential splicing event
 - c. Required files not included in this repo:
 - i. Bam files (generated by STAR – very large)

- ii. `gencode.v47.primary_assembly.annotation.gtf` (downloaded from GENCODE – very large)
